

How to Run

City General Hospital Management System

Python CLI	Run <code>main.py</code> in terminal — menu-driven interface
Browser UI	Open <code>HospitalSystem_UI.html</code> in any browser
Requirements	Python 3.10+ Any modern web browser No extra packages

PART 1 — Running the Python CLI

About: The CLI is a terminal application. All data lives in memory — it resets when you close the session.

1 Check Your Python Version

Open a terminal (Command Prompt, PowerShell, or any Unix shell) and verify Python is installed:

```
python --version
# or on some systems:
python3 --version
```

You need Python 3.10 or higher. The version number should start with 3.10, 3.11, 3.12, or above.

Note: If Python is not installed, download it from python.org and follow the installer for your OS.

2 Download & Extract the Project Files

Download `HospitalSystemFull.zip` and extract it to a folder of your choice. You should have these files inside the folder:

- `main.py` — CLI entry point
- `hospital.py` — core engine
- `patient.py`, `doctor.py`, `staff.py`, `person.py`
- `room.py`, `appointment.py`, `bill.py`, `specialization.py`
- `data_seeder.py` — sample data loader

Tip: Keep all files in the same folder. The modules import each other using relative paths.

3

Navigate to the Project Folder

In your terminal, change directory to wherever you extracted the files:

```
# Windows example:  
cd C:\Users\YourName\Downloads\HospitalSystemFull  
# macOS / Linux example:  
cd ~/Downloads/HospitalSystemFull
```

Tip: You can also drag-and-drop the folder into your terminal window to auto-fill the path.

4

Run the Application

Launch the CLI with:

```
python main.py  
# or if your system uses python3:  
python3 main.py
```

The program will seed sample data automatically and display the main menu:

```
=====
CITY GENERAL HOSPITAL – MANAGEMENT SYSTEM
=====
1) Patient Management
2) Doctor Management
3) Room Management
4) Appointments
5) Billing
6) Staff Management
7) Hospital Summary
8) Exit
Choice:
```

5

Navigate the Menus

Type the number next to any option and press Enter. Each module has its own sub-menu. For example, selecting 1 opens Patient Management:

- 1) Register new patient
- 2) List all patients
- 3) View patient details
- 4) Search patient by name
- 5) Admit patient to room
- 6) Discharge patient
- 7) Add medical record
- 8) Add prescription
- 9) Back to main menu

Tip: Choose option 7 (Hospital Summary) from the main menu to see a live count of all patients, doctors, rooms, and revenue.

6

Exit the Application

From the main menu, select option 8 (Exit) and press Enter. The program will close cleanly.

Note: All data is stored in memory only. It will not be saved between sessions. Each run starts fresh with the seed data.

PART 2 — Running the Browser UI

About: The UI is a single HTML file. No installation, no server, no internet connection required after the file is on your computer.

1

Locate the HTML File

Find the file named HospitalSystem_UI.html (it may also be called HospitalSystem_UI_2_.html). It is a single self-contained file — everything is built in.

Tip: You can store this file anywhere on your computer — desktop, Downloads folder, USB drive, etc.

2

Open in Your Browser

Double-click the HTML file. It will open automatically in your default web browser. Alternatively, you can right-click the file and choose:

- Open with > Google Chrome
- Open with > Mozilla Firefox
- Open with > Microsoft Edge
- Open with > Safari (macOS)

Note: Any modern browser from 2020 onwards will work. Internet Explorer is not supported.

3

Wait for the Dashboard to Load

The page loads instantly. You will see the main dashboard with pre-loaded sample data already in place — patients, doctors, rooms, staff, and bills are all seeded automatically.

Tip: Look at the stat cards at the top of the dashboard to confirm data has loaded: you should see counts for Patients, Doctors, Rooms, and Revenue.

4

Navigate Using the Sidebar

Click any item in the left-hand sidebar to switch modules:

- Dashboard — overview stats and summaries
- Patients — register, search, and view patient records
- Doctors — manage doctor profiles and availability
- Rooms — view the room grid, allot and vacate rooms
- OPD Queue — add patients to queue and call next
- Appointments — book and track appointments
- Billing — create bills, add items, mark as paid
- Staff — register and view non-clinical staff

5

Use the Global Search Bar

The search box in the top bar lets you find any patient or doctor instantly by name or ID (e.g. PAT0001 or DOC0002). Type and press Enter to jump directly to their record.

Tip: Patient IDs follow the format PAT0001, PAT0002, etc. Doctor IDs start with DOC0001.

6

Add New Records

Each module has an Add / Register / Book button (usually in the top-right of its panel). Click it to open a modal form, fill in the details, and submit. A green toast notification will confirm the action.

Note: All data is stored in the browser's memory only. Refreshing or closing the tab will reset everything back to the seed data.

Troubleshooting

Problem: 'python' is not recognised (Windows)

Solution: Try python3 main.py instead. If still not found, reinstall Python from python.org and tick 'Add Python to PATH' during setup.

Problem: ModuleNotFoundError: No module named 'patient'

Solution: You are running main.py from the wrong directory. Use cd to navigate into the HospitalSystemFull folder first, then run the script.

Problem: The HTML file opens but shows a blank page

Solution: Try a different browser. Right-click the file, choose Open With, and select Chrome or Firefox. Avoid opening from a network share or inside a ZIP archive — extract the file first.

Problem: Menu input not accepted (CLI)	Solution: Enter only the number shown (e.g. 1, 2, 3) and press Enter. Do not type letters or extra spaces.
Problem: Data disappeared after refresh (UI)	Solution: This is expected behaviour — the browser UI uses in-memory storage only. Your changes are not persisted between page loads.
